

# Predicting a Structured Semantic Representation for Text (And What We Can Do With One)

Vivek Srikumar

# Outline

## 1. Semantic Role Labeling

- Looking beyond verbs and nominalizations
- Preposition relations

## 2. Using a semantic representation

- Looking beyond sentences
- Reading comprehension

# Understanding text

On Feb. 20, 1962, a Marine Corps fighter pilot from small-town America stepped forward in response to the country's need. The astronaut was John Glenn, whom the author Tom Wolfe has called "the last true national hero America has ever had".

On Monday and Tuesday, Glenn will be honored with a dinner and a spaceflight forum at Ohio State University, home of the John Glenn School of Public Affairs.

- Tom Wolfe is an author.
- The spaceflight forum is located in the Ohio State University.
- John Glenn will be honored on Monday.
- John Glenn School of Public Affairs is located at the Ohio State University.

# Understanding text

On Feb. 20, 1962, a Marine Corps fighter pilot from small-town America stepped forward in response to the country's need. The astronaut was John Glenn, whom the author Tom Wolfe has called “the last true national hero America has ever had”.

On Monday and Tuesday, Glenn will be honored with a dinner and a spaceflight forum at Ohio State University, home of the John Glenn School of Public Affairs.

Who called John Glenn “the last true national hero America has ever had”?

**~~A: The astronaut~~**

**B: The author Tom Wolfe**

Dan Roth

# Representing Predicates and Arguments

Extending Semantic Role Labeling: Prepositions and more

[Srikumar & Roth '11, '13]

# Semantic Role Labeling (SRL)

Given a sentence, identifies who does what to whom, where and when.

The astronaut was John Glenn, whom the author Tom Wolfe has  
“the last true national hero America has ever had.”

called

Predicate

Relation: Call

Arguments

Caller[A0]: the author Tom Wolfe

Item being labeled [A1]: John Glenn

Attribute [A2]: the last true national hero America has ever had

“the author Tom Wolfe” fulfills the role of *Caller* for the predicate Call

Who called John Glenn “the last true national hero America has ever had”?

# Verbs do not give the full picture

On Feb. 20, 1962, a Marine Corps fighter pilot from small-town America stepped forward in response to the country's need. The astronaut was John Glenn, whom the author Tom Wolfe has called "the last true national hero America has ever had".

On Monday and Tuesday, Glenn will be honored with a dinner and a spaceflight forum at Ohio State University, home of the John Glenn School of Public Affairs.

- ✗ Tom Wolfe is an author.
- ✗ The spaceflight forum is located in the Ohio State University.
- ✓ John Glenn will be honored on Monday.
- ✗ John Glenn School of Public Affairs is located at the Ohio State University.

# Prepositions trigger relations

John enjoyed the visit to the zoo in NYC.

- Enjoy
  - **Agent/Enjoyer**: John
  - **Cause/Thing-enjoyed**: the visit to the zoo in NYC
- Visit
  - **Agent**: John
  - **Destination**: the zoo in NYC

Q: Where is the zoo located?

A: NYC.

# **Ontology of Preposition Relations**

# Examples of preposition relations

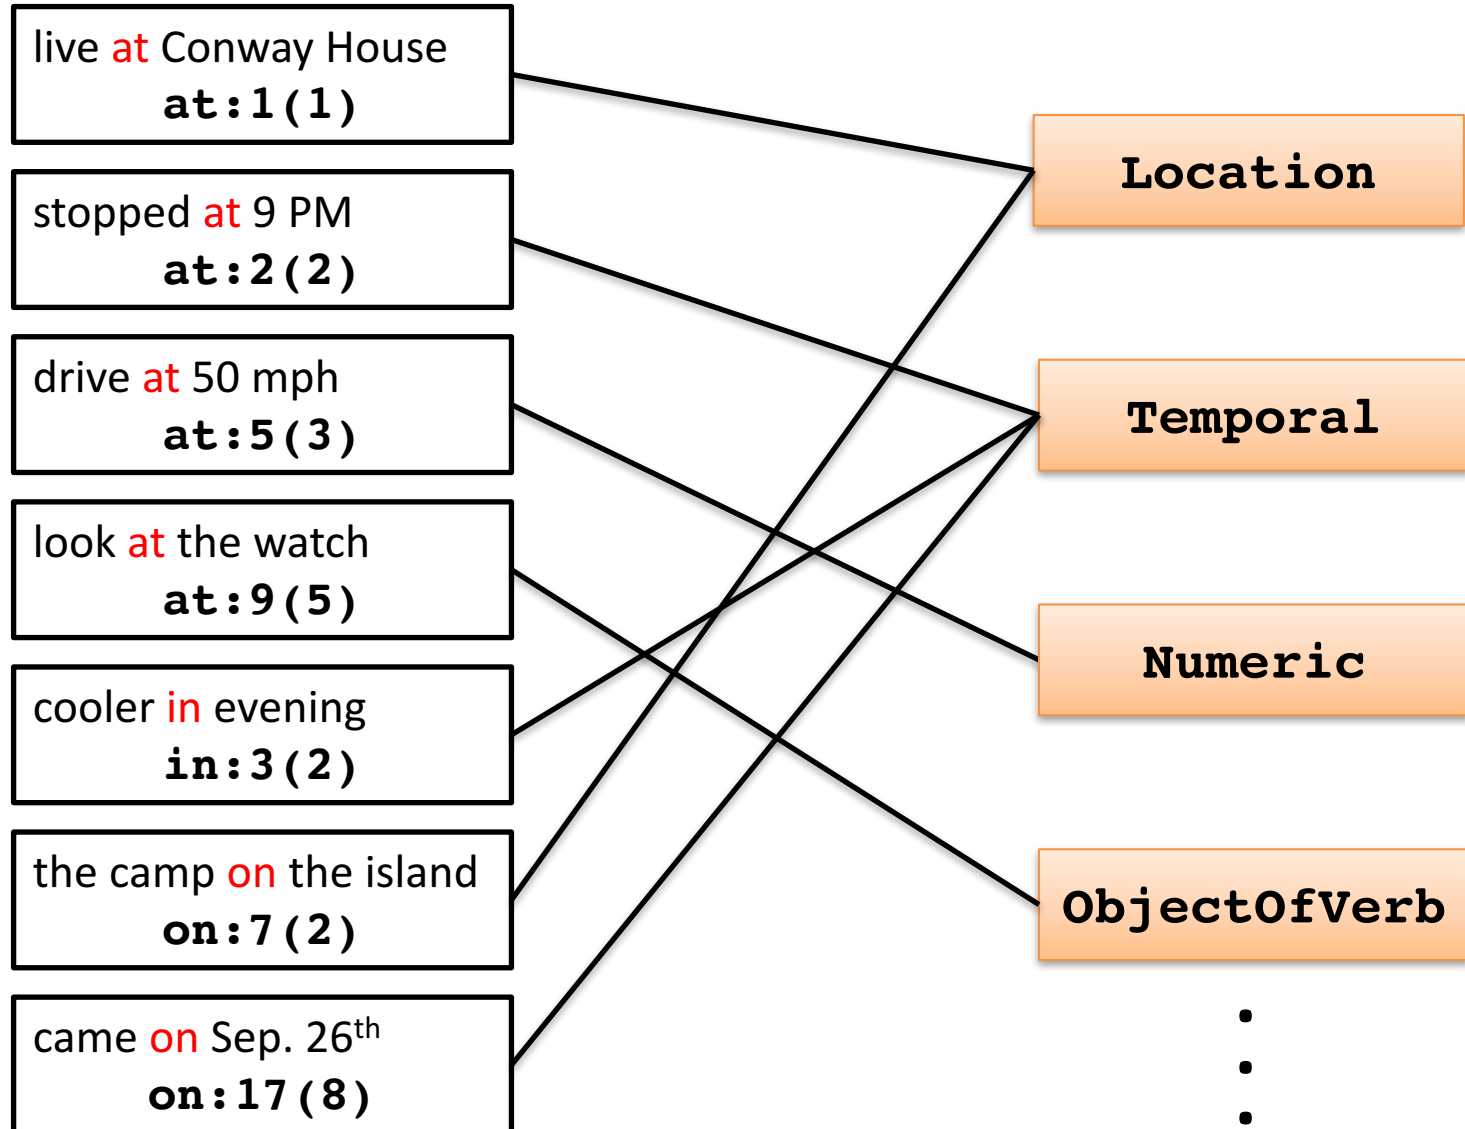

# Preposition Sense Disambiguation

Eg. *State of Illinois* vs. *University of Illinois*

- The Preposition Project [Litkowski and Hargraves, 2005]
  - Word sense for 34 prepositions
  - Based on preposition definitions in Oxford Dictionary of English

# Mapping from senses to relations

# An inventory of preposition relations

- Labels that act as the predicate
  - Semantically related senses of prepositions merged
  - ~250 senses → 32 relation labels
- Word sense disambiguation data, re-labeled
  - SemEval 2007 shared task gives relation labeled data
    - ~16K training and ~8K test instances
    - 34 prepositions

# List of preposition relations

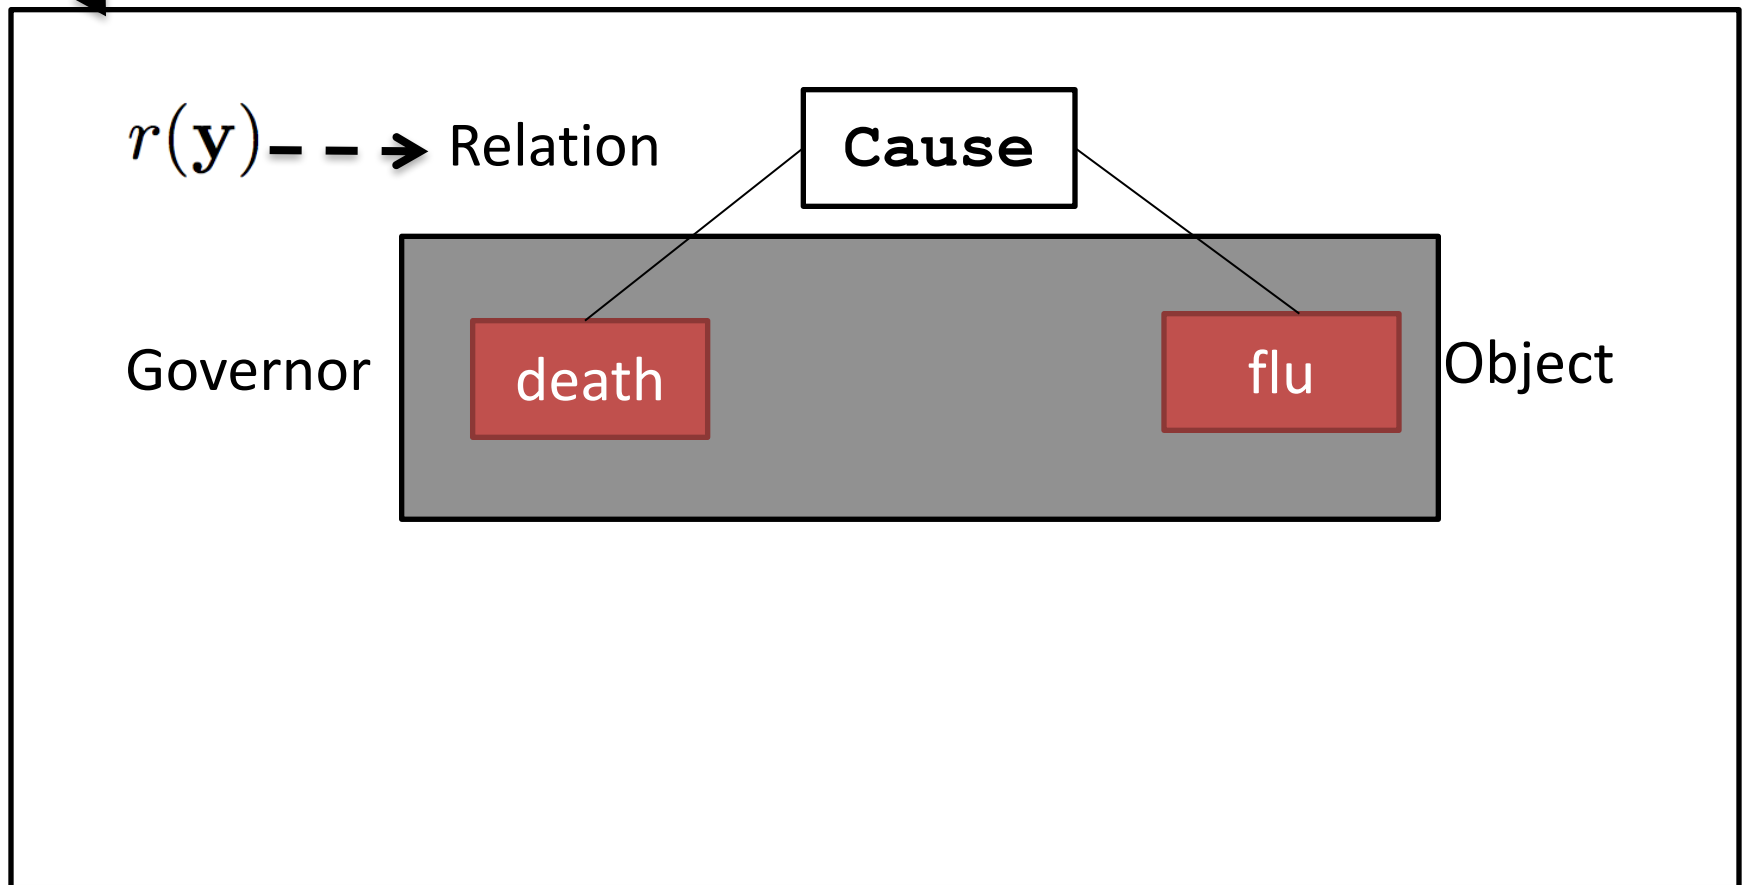

Relation	Train	Test	Relation	Train	Test
Activity	63	39	Opponent/Contrast	233	131
Agent	367	159	Other	72	42
Attribute	510	266	PartWhole	958	471
Beneficiary	205	105	Participant/Accompanier	292	142
Cause	591	289	PhysicalSupport	399	202
Co-Particiants	112	58	Possessor	508	269
Destination	1054	526	ProfessionalAspect	45	22
Direction	909	441	Purpose	261	113
EndState	188	104	Recipient	378	190
Experiencer	116	54	Separation	345	172
Instrument	565	290	Source	740	357
Location	3096	1531	Species	394	198
Manner	457	245	StartState	69	37
MediumOfCommunication	57	30	Temporal	331	157
Numeric	113	48	Topic	886	462
ObjectOfVerb	1801	882	Via	61	26

“zoo in NYC”  $\longrightarrow$  `Location(zoo, NYC)`

## Two Models for Predicting Preposition Relations

# Structure of prepositions

$y$  Poor care led to her death **from** flu.

# Parser not sufficient for arguments

# Relation depends on argument types

Poor care led to her death **from** flu.

**Cause**(death, flu)

Poor care led to her death **from** pneumonia.

How do we generalize the classifier to unseen arguments in the same “type”?

# Why are types important?

- Goes beyond words
  - Abstract *flu* and *pneumonia* into the same group
- Some semantic relations hold only for certain types of entities
- Two notions of type
  - WordNet hypernyms
  - Distributional word clusters
  - Allow for multiple meanings and concept hierarchies

# WordNet IS-A hierarchy

pneumonia

=> respiratory disease

=> disease

=> illness

=> ill health

=> pathological state

=> physical condition

=> condition

=> state

=> attribute

=> abstraction

=> entity

Picking the right level in this hierarchy can generalize pneumonia and flu

More general, but less discriminative

Picking incorrectly will over-generalize

# Type #2: Word clusters

Cover all points with fixed radius clusters. Repeat with a different radii.

# Example clusters

---

Jimmy Carter	metalwork	fox news channel	expert
Ronald Reagan	porcelain	NBC News	Wall Street analyst
richard nixon	handicraft	MSNBC	analyst
George Bush	jade	Fox News	economist
Lyndon Johnson	bronzeware	CNBC	telecommunications analyst
Richard M.	carving	CNNfn	strategist
Nixon	pottery	C-Span	media analyst
Gerald Ford	ceramic		
	earthenware		
	jewelry		
	stoneware		
	lacquerware		

---

# Structure of prepositions

$y$ , Poor care led to her death **from** flu.

# Governor and object base features

1. Word, POS, lemma and capitalization indicator
2. Conflated part-of-speech (Noun/Verb/Adjective/Adverb/Other)
3. Indicator for existence in WordNet,
4. WordNet synsets for the first and all senses,
5. WordNet lemma, lexicographer file names and part, member and substance holonyms,
6. Roget thesaurus divisions for the word,
7. The first and last two and three letters, and
8. Indicators for known affixes.

# Two models

- Model 1
  - Predict only relation label: Multi-class
  - Use features from all possible governor and object candidates
    - Also types
- Model 2 uses features from the structure
  - Predict full structure: relation and arguments
    - Also types

# Model 1: Predict relation label

Poor care led to her death **from** flu.

*Relation*

Attribute
Cause
Source

Paint from resin

Cause

Weak from asthma

Source

Candidate from Montreal

⋮

*Governor*

led
her
death

*Object*

flu
-----

Features from all  
sources

*Governor type*

lead	change in state	killing	er
produ	event	point in time	
travel	state	ending	

*Object type*

contagious disease
communicable disease
disease

# Model 2: Predict full structure

Poor care led to her death **from** flu.

*Relation*

Attribute
Cause
Source

Paint from resin

Weak from asthma

Candidate from Montreal

⋮

*Governor*

led
her
death

*Object*

flu
-----

*Governor type*

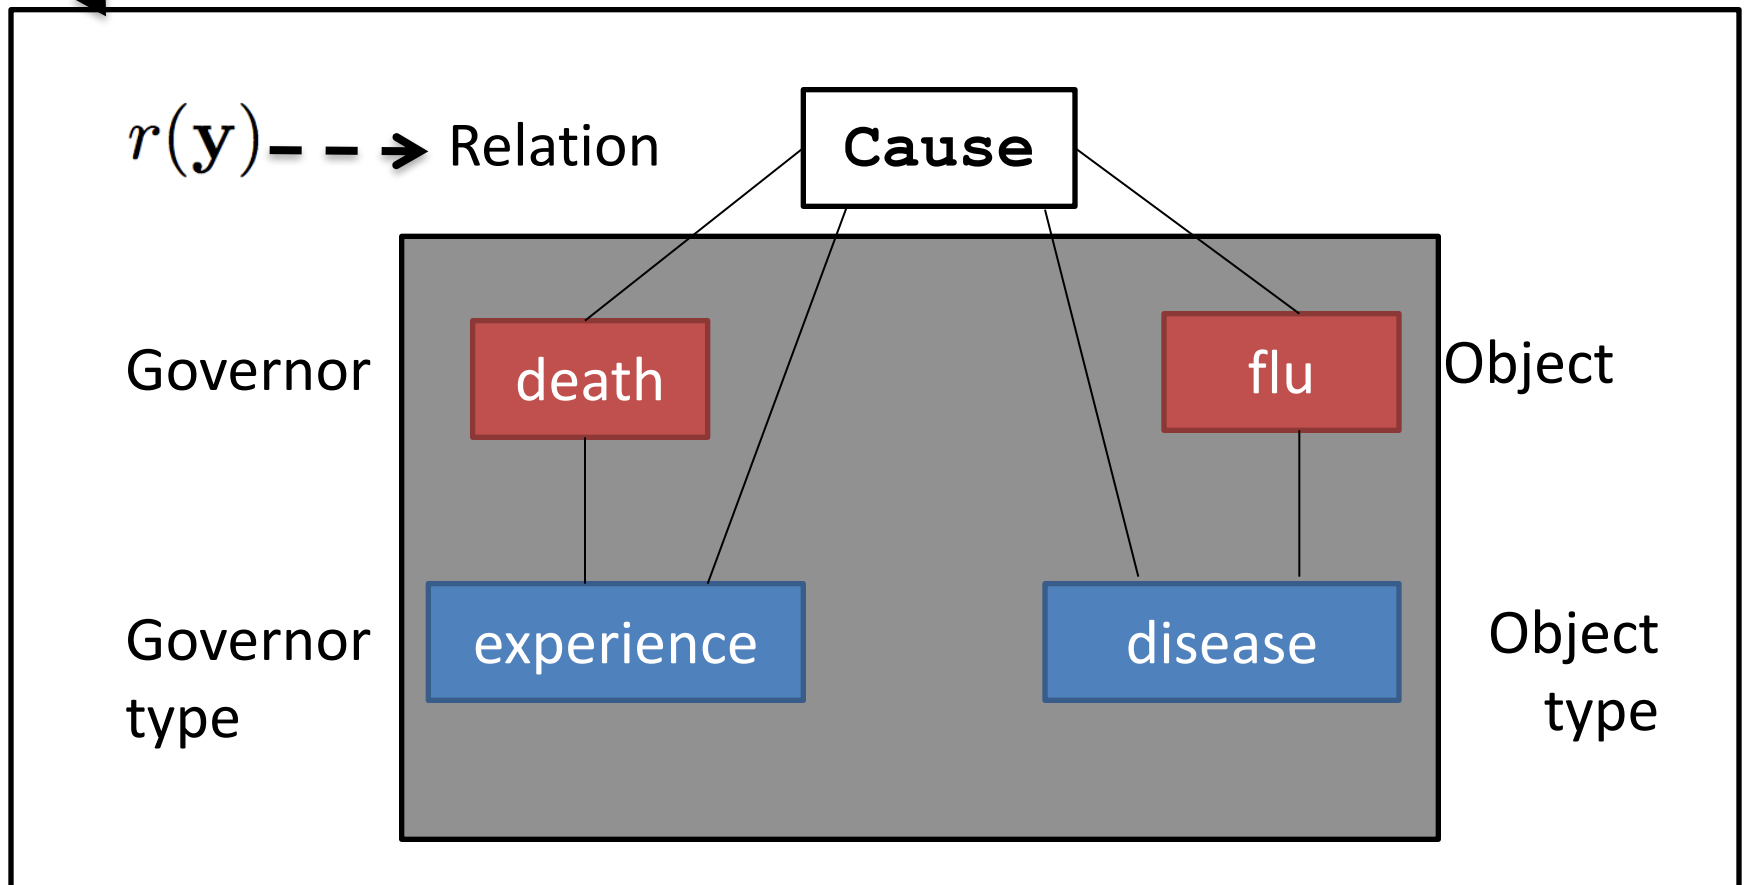

lead	change in state	killing	er
produ	event	point in time	
travel	state	ending	

*Object type*

contagious disease
communicable disease
disease

# Structure of prepositions

$y$ , Poor care led to her death **from** flu.

# Learning Model 2: Latent inference

- *Standard inference*: Find an assignment to the full structure

$$\max_{\mathbf{y}} \mathbf{w}^T \Phi(\mathbf{x}, \mathbf{y})$$

- *Latent inference*: Given an example with annotated  $r(\mathbf{y}^*)$

$$\max_{\mathbf{y}} \quad \mathbf{w}^T \Phi(\mathbf{x}, \mathbf{y})$$

$$\text{s.t.} \quad r(\mathbf{y}^*) = r(\mathbf{y})$$

- “Complete the structure given current model”

# Standard Supervised Learning

Structured SVM: [Tsochantaridis, et al 2004]

- Given a collection of labeled examples  $\{(\mathbf{x}_i, \mathbf{y}_i)\}$  find a scoring function that minimizes loss

$$\min_{\mathbf{w}, \xi} \frac{1}{2} \mathbf{w}^T \mathbf{w} + C \sum_i \xi_i$$

$$\begin{array}{ccccc} \text{Score of annotated} & & & & \text{Penalty for} \\ \text{structure} & \geq & \text{Score of any} & + & \text{predicting other} \\ & & \text{other structure} & & \text{structure} \end{array}$$

- Several algorithms for learning.
  - We use the SVM solver from [Chang et al, 2010]

# Learning Model 2

- Initialize weight vector using Model 1
- Repeat
  - Use latent inference with current weight to “complete” all missing pieces
  - Train with Structured SVM
    - During training, the learning algorithm is penalized more if it makes a mistake on  $r(\mathbf{y})$

Generalization of Latent Structure SVM [Yu & Joachims '09]

# Penalizing mistakes during learning

$$\min_{\mathbf{w}, \xi} \frac{1}{2} \mathbf{w}^T \mathbf{w} + C \sum_i \xi_i$$

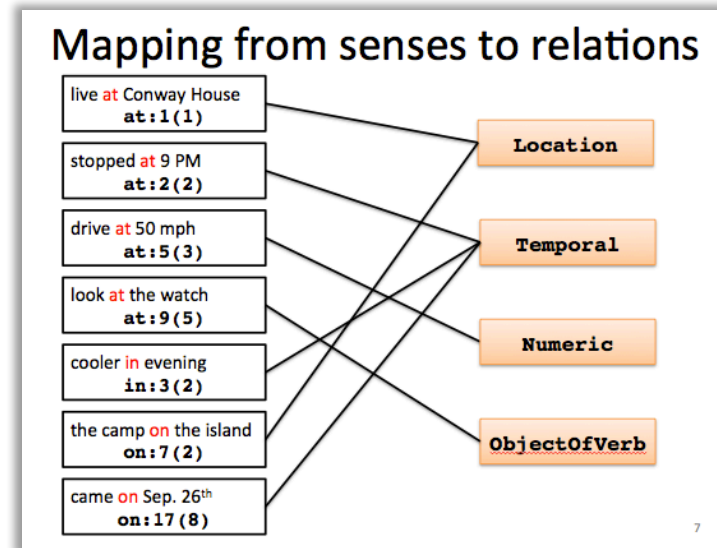

Score of annotated structure  $\geq$  Score of any other structure  $+ \Delta(\mathbf{y}, \mathbf{y}_i) - \xi_i$

- Penalty for making a mistake must not be the same for the labeled and inferred parts
  - Reduced penalty for mistakes made for anything except  $r(\mathbf{y})$
  - Modified loss-augmented inference

# Coherence with word sense

- Each sense corresponds to a relation

- Can explicitly enforce coherence
  - Model 1 or 2 for predicting relations
  - State-of-the-art preposition WSD [Hovy et al, 2010]
  - Coherence constraints from relation definition

# Preposition Sense and Relations

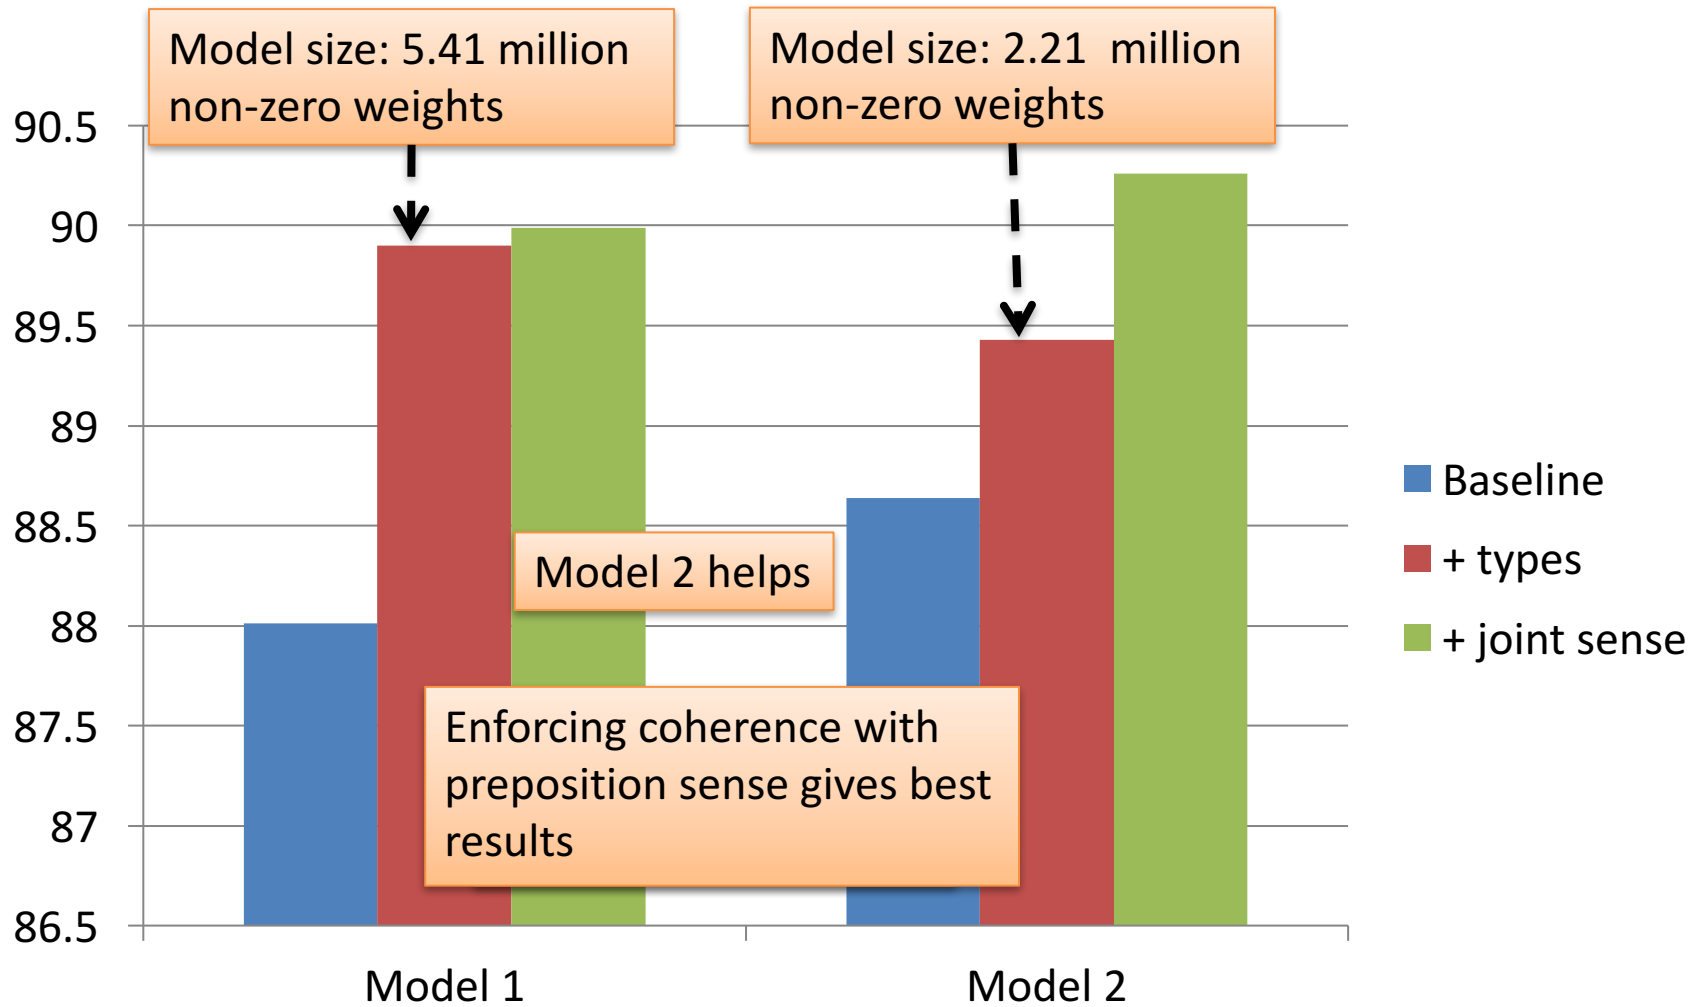

Poor care led to her death **from** flu.

## Mapping from senses to relations

# Experiments

# Accuracy of relation labeling

# Analysis

- Sharing features across prepositions helps
  - Possible because the label space is the same
  - Not the case for WSD
- Parser or heuristics alone is not good enough
  - Combining them gives the best performance

# Results summary

- Selecting a single assignment to arguments and types helps
- Enforcing coherence with preposition sense also helps
- Not fully believing the parser is useful
- Types are important

# What do we have?

Input	Relation	Governor type	Object type
Died of pneumonia	Cause	Experience	Disease
Suffering from flu	Cause	Experience	Disease
Recovered from flu	StartState	Change	Disease

Governor, object and their types as a certificate for the choice of relation label

# Summary

- Prepositions express a diverse set of relations
  - An ontology of preposition relations
  - Can enrich existing PropBank/FrameNet representation
- Models for predicting preposition relations
  - Arguments and types help

Data, word clusters, software available

# Outline

## 1. Semantic Role Labeling

- Looking beyond verbs and nominalizations
- Preposition relations

## 2. Using a semantic representation

- Looking beyond sentences
- Reading comprehension

# What can we do with a semantic representation?

Modeling Biological Processes for Reading Comprehension

In review

# Understanding text

On Feb. 20, 1962, a Marine Corps fighter pilot from small-town America stepped forward in response to the country's need. The astronaut was John Glenn, whom the author Tom Wolfe has called “the last true national hero America has ever had”.

On Monday and Tuesday, Glenn will be honored with a dinner and a spaceflight forum at Ohio State University, home of the John Glenn School of Public Affairs.

Who called John Glenn “the last true national hero America has ever had”?

**~~A: The astronaut~~**

**B: The author Tom Wolfe**

# Reading comprehension can be hard!

Water is split, providing a source of electrons and protons (hydrogen ions,  $H^+$ ) and giving off  $O_2$  as a by-product. Light absorbed by chlorophyll drives a transfer of the electrons and hydrogen ions from water to an acceptor called  $NADP^+$ .

The diagram illustrates the process of water splitting and electron transfer. It features a paragraph with several words and phrases highlighted in colored boxes: 'Water' (brown), 'is split,' (blue), 'providing' (blue), 'a source of electrons and protons' (brown), '(hydrogen ions, H+)' (black), 'and giving off O2 as a by-product.' (black), 'Light absorbed' (blue), 'by chlorophyll' (blue), 'drives' (blue), 'a transfer' (blue), 'of the electrons and' (brown), and 'hydrogen ions' (brown). Two curved arrows are drawn above the text. The first arrow starts at the 'Water' box and points to the 'is split,' box. The second arrow starts at the 'providing' box and points to the 'a source of electrons and protons' box. A third curved arrow starts at the 'drives' box and points to the 'a transfer' box. A fourth curved arrow starts at the 'of the electrons and' box and points to the 'hydrogen ions' box.

What does the splitting of water lead to?

**A:** Light absorption

**B:** Transfer of ions

# Reading comprehension can be hard!

*Water is split*, providing a source of electrons and protons (hydrogen ions,  $H^+$ ) and giving off  $O_2$  as a by-product. *Light absorbed* by chlorophyll drives a *transfer of the electrons and hydrogen ions* from water to an acceptor called  $NADP^+$ .

```
graph LR; A[Water is split] -- Enable --> B[providing a source of electrons and protons]; C[Light absorbed] -- Cause --> D[drives a transfer of the electrons and hydrogen ions];
```

What does the splitting of water lead to?

**A:** Light absorption

**B:** Transfer of ions

# Section Outline

1. A new reading comprehension task that requires reasoning over process structure
2. A new dataset `ProcessBank` consisting of descriptions of biological processes with
  1. Rich process structure annotated
  2. Multiple-choice questions
3. A new reading comprehension method
  1. Predict structure and treat it as a knowledge base
  2. Parse question as query to this KB

**A new data set**

# Motivation

- Macro-reading vs. Micro-reading
  - Redundancy vs. reasoning

[Etzioni et al., 2006; Carlson et al., 2010; Fader et al., 2011] vs [Richardson et al., 2013; Kushman et al., 2014]
- Non-factoid questions
- Modeling process structures
  - Events, entities and event-causality
  - Generally applicable to many situations

# Non-factoid questions: AP Exam

In the development of a seedling, which of the following will be the last to occur?

- A. Initiation of the breakdown of the food reserve
- B. Initiation of cell division in the root meristem
- C. Emergence of the root
- D. Emergence and greening of the first true foliage leaves
- E. Imbibition of water by the seed

Actual order: E A C B D

# Interlude: Winograd questions

**Q:** *The town councillors refused to give the angry demonstrators a permit because they feared violence. Who feared violence?*

**A1:** The town councillors

**A2:** The angry demonstrators

**Q:** *The town councillors refused to give the angry demonstrators a permit because they advocated violence. Who advocated violence?*

**A1:** The town councillors

**A2:** The angry demonstrators

- “*Google-proof*” questions
- “*No cheap tricks*” questions [Levesque '13]

# Making a difficult reading comprehension data set

- 200 paragraphs from the textbook *Biology*  
[Scaria, et al. 2013]
  - Each paragraph is a single biological process
- What we want:
  1. Questions should test an understanding of inter-relations between events and entities
  2. Both answers should have similar lexical overlap to trump shallow approaches

# Reading comprehension annotation

- 200 paragraphs: 585 questions
  - Created by a biologist
- Randomly chosen half validated by second annotator
  - 98.1% agreement
- Often requires complex reasoning about chains of event-event and event-entity relations

# Examples of annotated questions

## Dependencies between events/entities

**Q:** *What does the splitting of water lead to?*

**A:** Light absorption

**B:** Transfer of ions

## Temporal ordering of events

**Q:** *What is the correct order of events?*

**A:** PDGF binds to tyrosine kinases, then cells divide, then wound healing

**B:** Cells divide, then PDGF binds to tyrosine kinases, then wound healing

## True-False questions

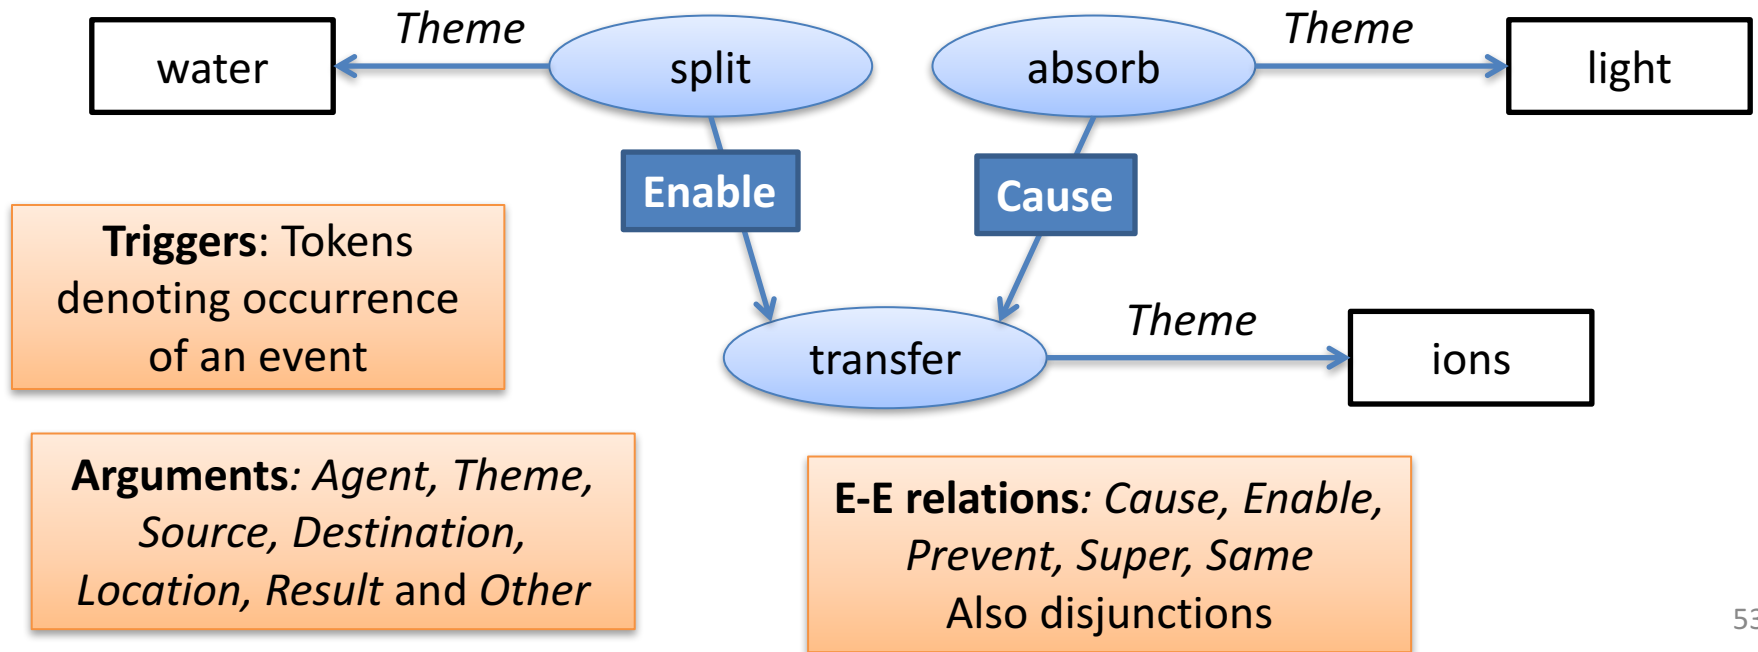

**Q:** *Cdk associates with MPF to become cyclin*

**A:** True

**B:** False

# The Structure of a Biological Process

**Water is split**, providing a source of electrons and protons (hydrogen ions,  $H^+$ ) and giving off  $O_2$  as a by-product. **Light absorbed** by chlorophyll drives a **transfer of the electrons and hydrogen ions** from water to an acceptor called  $NADP^+$ .

# Process structure annotation

- Same 200 paragraphs
- Three annotators
  - Biologists, independent from QA annotator
    - Potentially conflicting

Triggers	Arguments	Relations
7.0	11.3	7.9

Water is split, providing a source of electrons and protons (hydrogen ions,  $H^+$ ) and giving off  $O_2$  as a by-product. Light absorbed by chlorophyll drives a transfer of the electrons and hydrogen ions from water to an acceptor called  $NADP^+$ .

What does the splitting of water lead to?

**A:** Light absorption

**B:** Transfer of ions

# Modeling Processes to Answer Questions

# System overview

Process Structure  
Prediction

“... **Water is split**, providing a source of electrons and protons (hydrogen ions,  $H^+$ ) and giving off  $O_2$  as a by-product. **Light absorbed** by chlorophyll drives a **transfer of the electrons and hydrogen ions** from water to an acceptor called  $NADP^+$  ...”

Answering Question

- Q** What does the splitting of water lead to?
- a** Light absorption
  - b** Transfer of ions

Question Parsing

# Step 1: Structure prediction

- Event triggers
  - Classifier trained over all verbs, nouns, adjectives
- Arguments
  - Basically SRL
  - Argument identification + classification
- Event-event relations
  - Label all pairs of triggers (directed edges)
- Joint inference between arguments and relations
  - Framed as integer linear program

# Constraints

1. Unique labels for all candidates
2. No overlapping arguments
3. Relation symmetry
  - $R(a,b) \rightarrow \text{no } R(b, a)$ , except for SAME, where  $R(a,b) \rightarrow R(b,a)$
4. Maximum number of arguments per trigger
5. Maximum number of triggers per entity
6. Connectivity
7. Events that share arguments must be related
8. Unique SUPER parent

# Structure Prediction Performance

- Learned with structured perceptron
- Performance

	Precision	Recall	F1
Triggers	78.8	73.9	74.8
Arguments	42.5	33.9	37.7
Relations	26.5	21.8	23.9

# System overview

## Process Structure Prediction

“... **Water is split**, providing a source of trons and protons (hydrogen ions, H<sup>+</sup>) and giving off O<sub>2</sub> as a by-product. **Light absorbed** by chlorophyll drives a **transfer of the electrons and hydrogen ions** from water to an acceptor called NADP+ ...”

Step 1

- Q** What does the splitting of water lead to?
- a** Light absorption
  - b** Transfer of ions

## Question Parsing

## Step 2: Question parsing

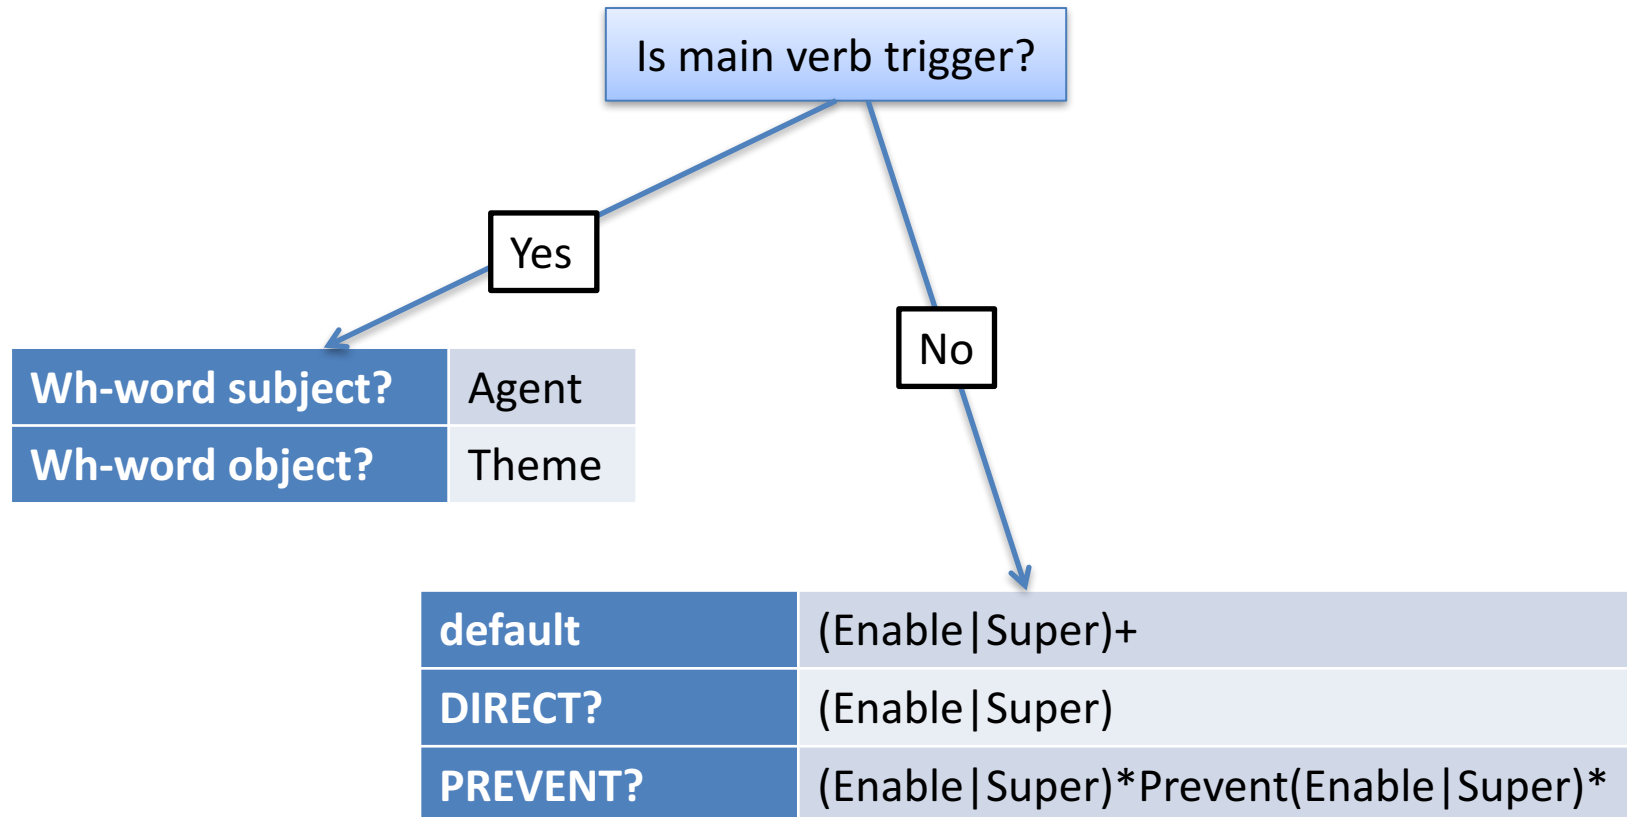

- Task: Given a question and two answers, produce two queries
  - One for each answer
- Question + answer  $\rightarrow$  path template in structure

# Deterministic query parsing

1. Align Q&A to structure
  - Recall that we limit lexical variability
2. Identify source and target
  - If multiple candidates, try all combinations
3. Identify regular expressions
  - Chose from small set (~10) of regular expressions

# Identifying regular expressions

# System overview

## Process Structure Prediction

“... **Water is split**, providing a source of trons and protons (hydrogen ions, H+) and giving off O<sub>2</sub> as a by-product. **Light absorbed** by chlorophyll drives a **transfer of the electrons and hydrogen ions** from water to an acceptor called NADP+ ...”

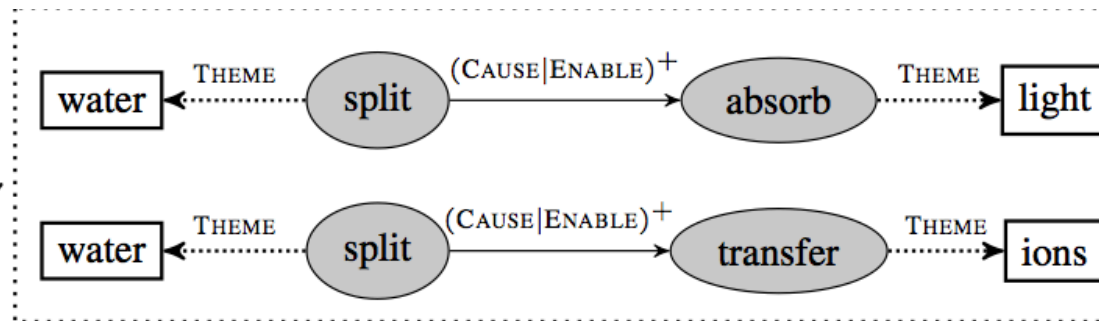

Step 1

## Answering Question

- Q** What does the splitting of water lead to?
- a** Light absorption
  - b** Transfer of ions

Step 2

## Question Parsing

# Step 3: Answering questions

- Given
  - Process structure
  - Two queries
- Answering algorithm
  1. Find matching path (valid proof)
  2. Else, find contradiction of causality (refutation)
  3. Else, find any path from source to target
  4. Else, back off to dependency based baseline

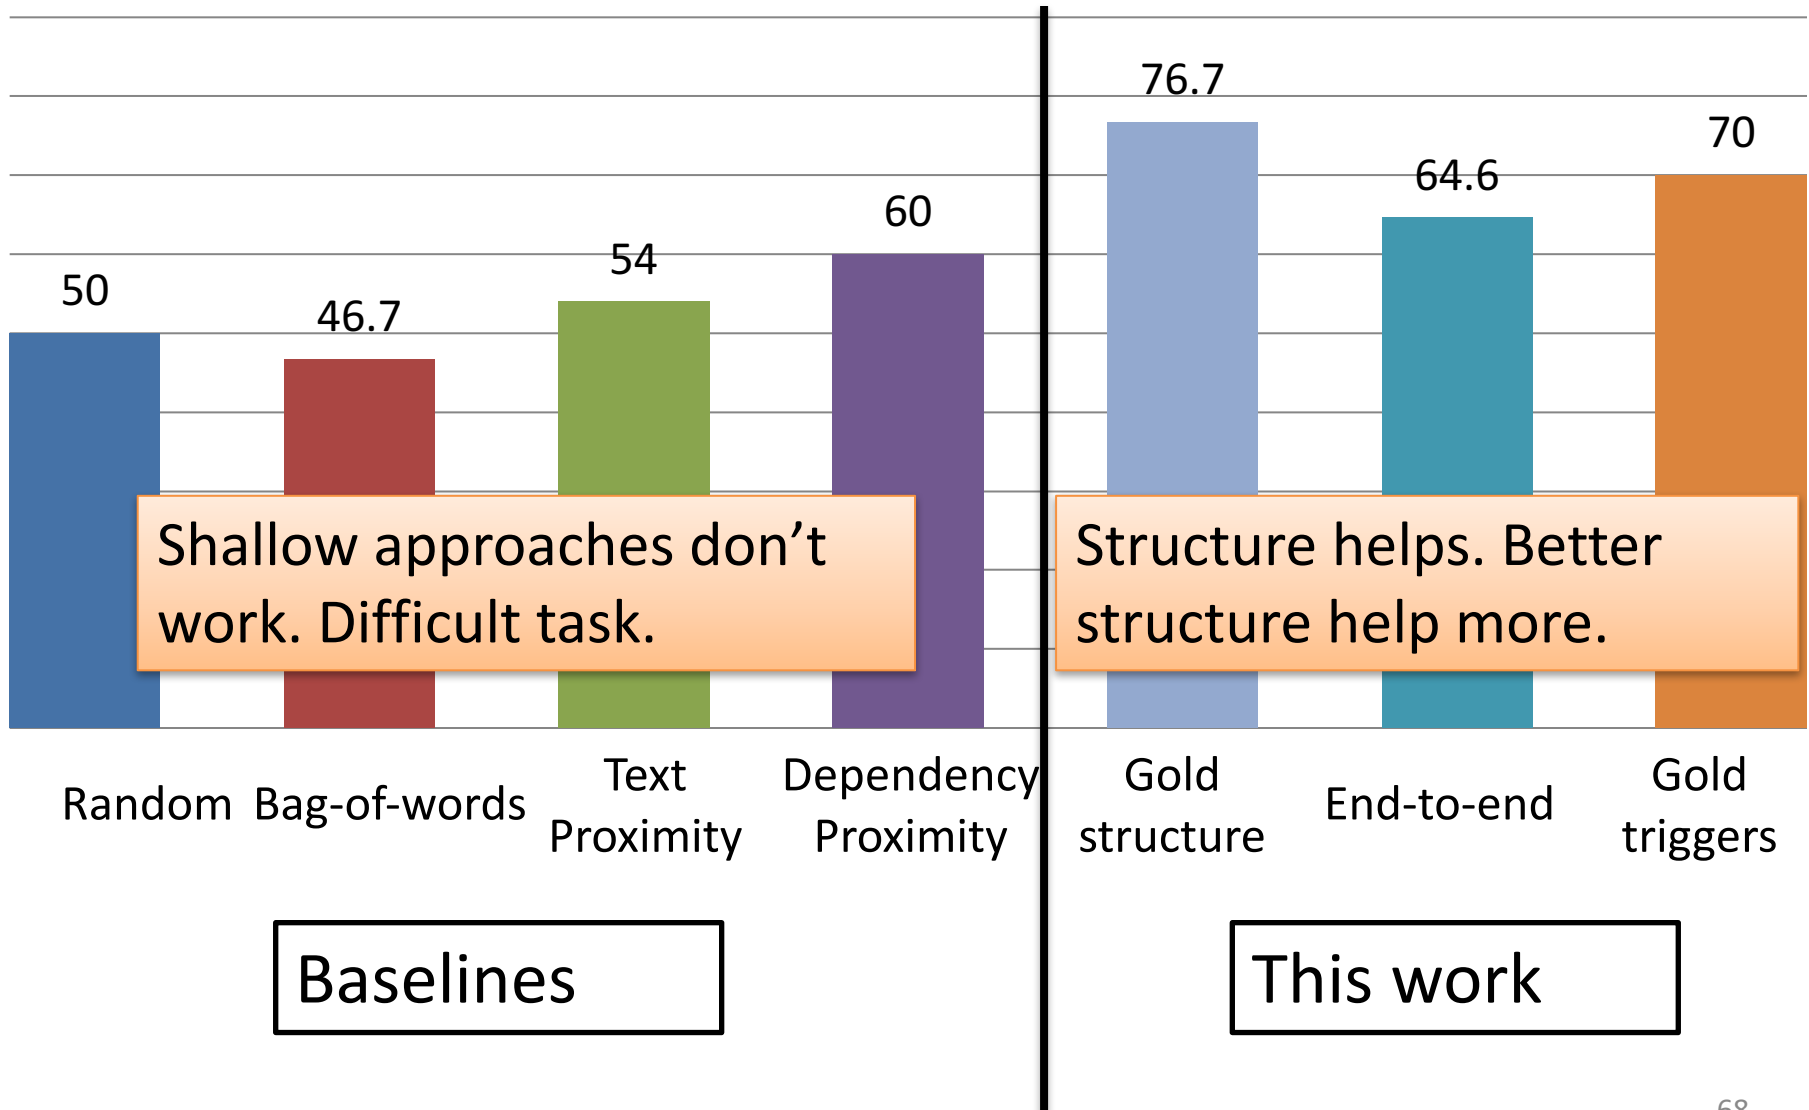

# Experiments and Results

# Experimental setup

- Train structure predictor on 150 paragraphs, test on 50 paragraphs
- Baselines
  - Bag of words
  - Text proximity of answer to question
  - Dependency based proximity

# Question Answering Accuracy

# Analysis

- Errors with gold structure mainly because of
  - Alignment problems
  - Relevant part of structure not annotated
  - Not modeling entity coreference
- Errors with predicted structure
  - Mostly because of prediction errors
  - Sometimes, we get the answer even if the structure is incorrect in other places

# Summary

1. A new reading comprehension task that requires reasoning over process structure
2. A new dataset `ProcessBank` consisting of descriptions of biological processes with
  - Rich process structure annotated
  - Multiple-choice questions
3. A new reading comprehension method
  - Predict structure and treat it as a knowledge base
  - Parse question as query to this KB

# Final words

- Extending SRL
  - Data and system available
  - Guiding spirit is similar to AMR
  - Also, ongoing work here
- What can we do with something like SRL
  - Process structure (further extends beyond sentence boundaries)
  - Can tackle difficult reading comprehension setup
  - Data and system will be available

Questions, Comments?

Also, another talk tomorrow
